

ARTROMIC PET'S

Tablets

Meat flavoured tablets

Artromic Pet's protects and regenerates articular cartilage, reducing pain and inflammation in joints with inflammatory or degenerative processes.

Composition:

Glucosamine sodium sulphate	0.628 g
(equivalent to 0.5 g of glucosamine sulphate)	
Chondroitin sodium sulphate	0.10 g
Manganese sulphate monohydrate	0.031 g (equivalent to 0.01 g of manganese)

Indications:

Artromic Pet's is used to protect and regenerate articular cartilage, reducing pain and inflammation in joints with acute or chronic inflammatory or degenerative processes. It may be used as complementary treatment in dysplasia, elderly patients or patients with prolonged joint immobilization.

It is also recommended in patients with factors predisposing the development of osteoarthritis such as overweight, joint injury, congenital joint disease, high performance training or articular or periarticular surgeries.

Contraindications and limitations:

Do not administer to patients with hypersensitivity to any of the active ingredients. Do not use in pregnant or lactating females. Its use is not recommended in animals with impaired renal function. Studies indicate that the use of glucosamine decreases the absorption of chloramphenicol and penicillin when administered at the same time.

Route of administration:

Oral.

Dosage:

Canine: up to 15 kg weight: ½ tablet/day. Animals over 15 kg weight: 1 tablet/day.

Feline: animals under 5 kg weight: ¼ tablet/day. Over 5 kg weight: ½ tablet/day.

A period of at least 45 days is recommended, but this may be modified according to the veterinarian's discretion.
