

# HIALMIC

## Chondroprotector for Equine Injectable solution

### Formula:

Each 100 mL contains:

Sodium hyaluronate PM: (550000-750000)

Dalton ..... 1 g

Water for injections q.s.ad.

..... 100 mL

### Indications:

Chondroprotector.

Sodium hyaluronate (hyaluronic acid), which is one of the main components of the articular cartilage and synovial fluid, acts as lubricant and buffer, and as restorer of the extracellular matrix and the fluid of the articular surfaces, protecting them from the impacts; it modulates several cellular functions by reducing the response to inflammation and pain.

It is also indicated for the prevention and treatment of articular disorders and dysfunctions of the carpus or tarsus, due to non-infectious synovitis associated with osteoarthritis. Prevention in healthy animals to improve performance sports (articular physiology support), required the development of the body, heavy animals, etc., in animals required for work and/or intense exercise, sports competitions.

For the treatment of articular pathologies indicated and/or post-surgical (articular surgery, arthroscopy, etc.)

### Target species:

Equine.

### Withdrawal period:

The product is indicated for equine not intended for human consumption.

### Route of administration and dosage:

Recommended dosage: \*4 mL (equivalent to 40 mg) by intravenous route, slowly applied in the jugular vein, once a week for three weeks in total; treatment can continue only under veterinarian's indications.

\*2 mL (equivalent to 20 mg) by intra-articular route. It may be repeated once or twice, with week intervals or according to the veterinarian's indications.

The animals after treatment should rest in the stable and then begin to work gradually, according to the veterinarian's discretion.
